

## STATUS REPORT FOR JUNIOR VOLTAIRE & SAIMER NIEVES

### WEEK 2

#### This week we worked on:

##### **Junior V:**

- Created a design for SQL table Layouts for login accounts for Owners and another table for login of customers.
- Created login.php page for users to log in customers/owners
- Created php file submit button of users to submit images when creating their website.

##### **Saimer N:**

- Begin researching coding ideas to design login and "*Creating a Website*" features. This completed the home page layout with coding of JavaScript/html.
- Finished table design for templates and product inventory users will save within their accounts
- Downloaded a new bootstrap for future templates layouts finished coding first template for customizing

**Both us:**

- Completed the prototype figma visual

**In the upcoming week we plan to:****Saimer N:**

- Create a buying.php page which shows the product your buying in detail.
- Finish shopping cart page. By creating a shopping cart database, we will add an ID to every store and separate each item in the shopping cart based on where they were purchased. Once we do that every time a person clicks a shopping cart in any page we will bring every pending purchase in the database.

**Junior V:**

- Create a table linking templates to user accounts with a foreign key
- Finish adding php file upload to every div that needs images as design.

**Both of Us:**

1. We have to test at least the creation of one sign up account and create a website using one template a customer could see.

## **Impediments/roadblocks**

### **Saimer N:**

- Organizing table in the best way to access the products pending and thinking of a way to display it appropriately without making it too messy.

### **Junior V:**

- Organizing the images uploads based on account. This will require a database where the images and templates names are saved.
